

# Health Canada/SUAP Drug-Checking Project - Standard Operating Procedures for Sample Preparation

To ensure our Laboratory Scientists can efficiently and effectively analyze your samples. Please refer to the following very brief guidelines and examples.

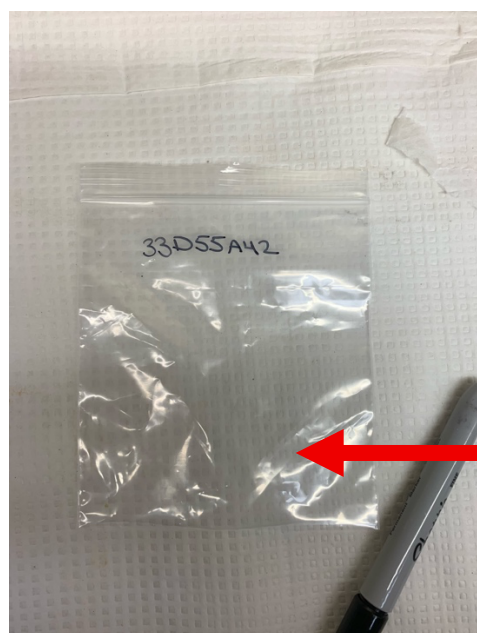

Please ensure your sample is placed in a proper clear plastic bag with a zip lock type closure mechanism (Top Example); or, within a pre-made paper envelop with a folding or otherwise type closure mechanism (Bottom 2 Examples).

Please refrain from placing your sample in a self-made folded piece of paper or sticky note and avoid using other adhesives as well.

Lastly, please there is at least 5mg or greater, of the sample substance. This is roughly analogous to the size of a wooden match head. Tiny fragments, flakes or dust, smaller than 5mg, will not be enough to properly analyze.

Thank you for your time and assistance, it is greatly appreciated!
